Ripples on a Puddle Oct 05 2020
The setting for Ripples on a Puddle is a fictional village in Northern Ontario called Tamarack. The opening story "Tamarack" describes the village and the assortment of small businesses bordering the main thoroughfare which also serves as a main provincial highway. The characters who appear in the stories are fictional but some events are based on actual inhabitants and their lives as observed by the

author who, at a young age, was a self-confessed eavesdropper. In her later years she chronicles the events as she remembers them. At times the stories are sad because they speak to tragic events. At other times they are humorous incidents in rural life. We meet these living, vulnerable people at extraordinary moments in their lives and in situations that ring true. The element of time plays an important role in some stories. Melissa MacGregor appears in several as both a young girl and as a waspish old woman greeting death in the final story, "Bitter Herbs." There are some surprises in these tales of people who find

themselves in situations of infanticide, lesbianism and doomed love, all a part of the human spirit that often brings stories that are memories of a bygone era that reflect the language, colloquialisms, customs and the simplicity of rural life.

-- it is not a parody of that book but its own entity. As one of the characters from the book says, We're still involved in the commission of the acts that will require redemption -- and those stories are always so much more fun. Bonkers and his bizarre team embarks on a gonzo tear through the streets of Los Angeles and across the pop cultural landscape as well. In his satirical quest for truth in journalism, and life, he must navigate through the many odd tiers of social class, in both the Southern California culture and in his Machiavellian office life and its absurd red and blue political divisions. Model Reduction and Approximation Oct 25 2019

Many physical, chemical, biomedical, and technical processes can be described by partial differential equations or dynamical systems. In spite of increasing computational capacities, many problems are of such high complexity that they are solvable only with severe simplifications, and the

design of efficient numerical schemes remains a central research challenge. This book presents a tutorial introduction to recent developments in mathematical methods for model reduction and approximation of complex systems. *Model Reduction and Approximation: Theory and Algorithms* contains three parts that cover (I) sampling-based methods, such as the reduced basis method and proper orthogonal decomposition, (II) approximation of high-dimensional problems by low-rank tensor techniques, and (III) system-theoretic methods, such as balanced truncation, interpolatory methods, and the Loewner framework. It is

tutorial in nature, giving an accessible introduction to state-of-the-art model reduction and approximation methods. It also covers a wide range of methods drawn from typically distinct communities (sampling based, tensor based, system-theoretic).?? This book is intended for researchers interested in model reduction and approximation, particularly graduate students and young researchers.

Physical Layer Security in Random Cellular Networks

Mar 22 2022 This book investigates key security issues in connection with the physical

layer for random wireless cellular networks. It first introduces readers to the fundamentals of information theoretic security in the physical layer. By examining recently introduced security techniques for wireless point-to-point communications, the book proposes new solutions to physical layer security based on stochastic geometric frameworks for random cellular networks. It subsequently elaborates on physical-layer security in multi-tier heterogeneous networks. With the new modeled settings, the authors also verify the security performance with the impact of the full-duplex transceivers. The specific model design

presented here offers a valuable point of reference for readers in related areas. In addition, the book highlights promising topics and proposes potential future research directions.

computer science, ontology, physics, biology, cognition, mathematical modelling, the structure of scientific theories, and the structure of the world. Moreover, it does this in a way that is accessible to non specialists. Each chapter is written by either a category-theorist or a philosopher working in one of the represented fields, in a way that builds on the concepts already familiar to philosophers working in these areas. The book is split into two halves. The 'pure' chapters focus on the use of category theory for mathematical, foundational, and logical purposes, while the 'applied' chapters consider the use of category theory for
