*Conditioned Emotional Reactions* Jun 26 2019 Psychology Classics: The Case of Little Albert Conditioned Emotional Reactions by John B. Watson and Rosalie Rayner is one of the most influential, infamous and iconic research articles ever published in the history of psychology. Commonly referred to as "The Case of Little Albert" this psychology classic attempted to show how fear could be induced in an infant through classical conditioning. Originally published in 1920, Conditioned Emotional Reactions remains among the most frequently cited journal articles in introductory psychology courses and textbooks. A psychology classic is by definition a must read. However, most seminal texts within the discipline remain unread by a majority of psychology students. A detailed, well written description of a classic study is fine to a point, but there is absolutely no substitute for understanding and engaging with the issues under review than by reading the authors unabridged ideas, thoughts and findings in their entirety. Bonus Material: One of the most dramatic aspects of Watson and Rayner's original study was that they had planned to test a number of methods by which they could remove Little Albert's conditioned fear responses. However, as Watson noted "Unfortunately Albert was taken from the hospital the day the above tests were made. Hence the opportunity of building up an experimental technique by means of which we could remove the conditioned emotional responses was denied us." This unforeseen turn of events was something that obviously stayed with Watson, as under his guidance some three years later, Mary Cover Jones conducted a follow-up study - A Laboratory Study of Fear: The Case of Peter - which illustrated how fear may be removed under laboratory conditions. This additional and highly relevant article is also presented in full. The Case of Little Albert has been produced as part of an initiative by the website All About Psychology to make important psychology publications widely available. *A Psychological Analysis of Adolf Hitler* Apr 04 2020 In 1943 William Donovan the director of the Office of Strategic Services (the forerunner to the CIA) approached Harvard psychologist Walter Langer and asked him to construct a psychological profile of Adolf Hitler. Despite his reservations regarding the reliability of the data upon which his analysis would be based, Langer set about this unprecedented task by putting together a team of psychologists and researchers. Langer and his research team had just five months to produce their findings, in which time they interviewed key informants who knew Hitler personally and drew upon over 1000 pages of background research from a document known as The Hitler Source Book. In order to try and understand Hitler as a person and the motivations underlying his actions, Langer presents his psychological profile within five specific sections 1. Hitler as he believes himself to be. 2. Hitler as the German people know him. 3. Hitler as his associates know him. 4. Hitler as he knows himself. 5. Psychological analysis and reconstruction. Freudianism at its Height In constructing a psychological analysis of Hitler, Langer drew heavily upon the ideas of Sigmund Freud, most notably the developmental influence of early childhood experiences. As such the report provides the reader with a fascinating window into the mechanics of Freudian analysis. Among the issues discussed within this paradigm are: Hitler's character as influenced by his father. Hitler's mother and her influence. Hitler's attitude towards love, women and marriage. Hitler's early conflicts expressed in symbolic form. The Messiah Complex. Desire for immortality. Hitler's Sexual development. A Classic in The History of Psychology Langer's report on Adolf Hitler not only showcased the dominant discourse of psychological analysis at the time, but it also served as the catalyst for the development of political profiling as a discipline. Psychology Gets Political Without doubt the greatest legacy of Langer's report was the influence it had on the field of political profiling. Dr Jerrold Post cites Langer's analysis of Hitler as the inspiration for the profiling unit he established at the CIA in the 1970s; which would subsequently go on to profile every important world leader up to and including Saddam Hussein. In discussing Langer's psychological profile of Hitler during an interview with the BBC, Post stated: "We must understand the leaders we are contending with - you can't deter optimally a leader you don't understand - and to relegate be it a Hitler or a Joseph Stalin or a Saddam Hussein to a crazy evil madman really degrades our capacity to deal with them optimally because we're not thinking about what pushes them, what makes them tick." While the value of political profiling remains open to question, the seminal importance of Langer's

psychological study of Hitler in influencing the discipline is not. A Psychological Analysis of Adolf Hitler has been produced as part of an initiative by the website All About Psychology to make important psychology publications widely available. **Theories of Emotion** Sep 09 2020 Emotion: Theory, Research, and Experience, Volume 1: Theories of Emotion, presents broad theoretical perspectives representing all major schools of thought in the study of the nature of emotion. The contributions contained in the book are characterized under three major headings - evolutionary context, psychophysiological context, and dynamic context. Subjects that are discussed include general psycho-evolutionary theory of emotion; the affect system; the biology of emotions and other feelings; and emotions as transitory social roles.

Psychologists, sociobiologists, sociologists, psychiatrists, ethologists, and students the allied fields will find the text a good reference material.

**Schedules of Reinforcement** Aug 21 2021 The contingent relationship between actions and their consequences lies at the heart of Skinner’s experimental analysis of behavior. Particular patterns of behavior emerge depending upon the contingencies established. Ferster and Skinner examined the effects of different schedules of reinforcement on behavior. An extraordinary work, Schedules of Reinforcement represents over 70,000 hours of research primarily with pigeons, though the principles have now been experimentally verified with many species including human beings. At first glance, the book appears to be an atlas of schedules. And so it is, the most exhaustive in existence. But it is also a reminder of the power of describing and explaining behavior through an analysis of measurable and manipulative behavior-environment relations without appealing to physiological mechanisms in the brain. As an exemplar and source for the further study of behavioral phenomena, the book illustrates the scientific philosophy that Skinner and Ferster adopted: that a science is best built from the ground up, from a firm foundation of facts that can eventually be summarized as scientific laws.
