Dissolution Testing of Solid Dosage Forms Feb 21 2022 Dissolution testing has been a key tool during drug development stages and for commercial preparation of the dosage forms. At the drug development stage, dissolution testing is used to help in formulation development evaluation of stability, monitoring of product consistency and assessment of the effect of variables (changes in formulation and process parameters) affecting the characteristics of the final product. In case of the commercial products, dissolution testing applied for confirmation of manufacturing and product consistency and evaluation of process variables. With the accumulation of both in vivo and in vitro experience during a product's development cycle, the dissolution test method should be critically re-

evaluated and potentially simplified for final quality control testing. This book covers dissolution testing of solid dosage forms, both conventional and novel dosage forms. Development and validation of dissolution testing methods for different types of tablets have been described as separate chapters.

Media for in Vitro Dissolution Testing of Polysaccharide Based CDDS Mar 22 2022 Till date, pursuit for cost effective and animal sparing colon specific bio-relevant dissolution media has been a foremost challenge facing pharmaceutical scientists over many decades. It is problematic to mimic the dynamic and ecologically diverse features of the colon in dissolution vessel. With the knowledge of enormous colonic microflora, the predominant species Bacteroides, Bifidobacterium, Eubacterium, Streptococcus and Lactobacillus species were cultured in 12% w/v skimmed milk powder and 5% w/v grade "A" honey. Probiotic culture was added to the dissolution media in order to test the drug release of polysaccharide based formulations. USP dissolution apparatus I/II with gradient pH dissolution method were used to evaluate the drug release from formulations meant for colonic drug delivery. Drug release from 5-fluorouracil granules and metronidazole tablets were assayed under gastric, small intestine conditions and also within a simulated colonic environment involving existing rat caecal, human fecal media and compared with novel probiotic media. The present method can be successfully applied for the drug release testing of any oral formulations meant for colonic delivery.

Poorly Soluble Drugs Jun 25 2022 This book is the first text to provide a comprehensive assessment of the application of fundamental principles of dissolution and drug release testing to poorly soluble compounds and formulations. Such drug products are, vis-à-vis their physical and chemical properties, inherently incompatible with aqueous dissolution. However, dissolution methods are required for product development and selection, as well as for the fulfillment of regulatory obligations with respect to biopharmaceutical assessment and product quality understanding. The percentage of poorly soluble drugs, defined in classes 2 and 4 of the Biopharmaceutics Classification System (BCS), has significantly increased in the modern pharmaceutical development pipeline. This book provides a thorough exposition of general method development strategies for such drugs, including instrumentation and media selection, the use of compendial and non-compendial techniques in product development, and phase-appropriate approaches to dissolution development. Emerging topics in the field of dissolution are also discussed, including biorelevant and biphasic dissolution, the use of enzymes in dissolution testing, dissolution of suspensions, and drug release of non-oral products. Of particular interest to the industrial pharmaceutical professional, a brief overview of the formulation and solubilization techniques employed in the development of BCS class 2 and 4 drugs to overcome solubility challenges is provided and is complemented by a collection of chapters that survey the approaches and considerations in developing dissolution methodologies for enabling drug delivery technologies, including nanosuspensions, lipid-based formulations, and stabilized amorphous drug formulations.

Additionally it aims to stimulate academic interest in the field of Nonclinical Statistics and promote this as an important discipline in its own right. This text brings together for the first time in a single volume a comprehensive survey of methods important to the nonclinical science areas within the pharmaceutical and biotechnology industries. Specifically the Discovery and Translational sciences, the Safety/Toxicology sciences, and the Chemistry, Manufacturing and Controls sciences. Drug discovery and development is a long and costly process. Most decisions in the drug development process are made with incomplete information. The data is rife with uncertainties and hence risky by nature. This is therefore the purview of Statistics. As such, this book aims to introduce readers to important statistical thinking and its application in these nonclinical areas. The chapters provide as appropriate, a scientific background to the topic, relevant regulatory guidance, current statistical practice, and further research directions.

Mathematical Models of Dissolution Jun 20 2019 Tablet dissolution testing where the drug release is observed as a function of time is an essential part of tablet formulation studies. These tests provide information about the dissolution mechanism and ensure the reproducibility of drug release, which is important for tablet quality assurance. However, the dissolution tests are time-consuming and thus optimal planning of experiment and sophisticated methods for its results evaluation would be needed. Identification of the parameters of specific dissolution models is crucial problem in dissolution studies. Aim of this thesis is to find the optimal time for observation of the empirical dissolution data if the parametric form of the dissolution profile is assumed to be known and the parameters should be estimated. Our approach is based on stochastic properties of the dissolution process and the Fisher information concept. Furthermore, basic models of dissolution and their stochastic modifications, including a new model based on the theory of stochastic differential equations, are presented. Parameters of studied models are estimated via maximum likelihood method.
